A browser chat where the server never sees the conversation.

P4Pair introduces browsers through a small signaling server, then moves messages, files, voice, and video directly between peers with WebRTC.

What it is

A peer-to-peer chat app with no accounts and no message database. Private rooms support two people with the complete feature set. Text group rooms support up to four people. The interface clearly shows whether browsers are waiting, connecting, or directly connected.

2 people in a private room	**4** people in a group room
0 accounts required	**25 MB** private file limit

What makes P4Pair stand out

The three highlighted features turn a small peer-to-peer chat into a complete browser communication app.

V

Video calls

Private peer-to-peer video with camera switching, mute, camera-off states, fullscreen, and a mobile landscape layout.

A

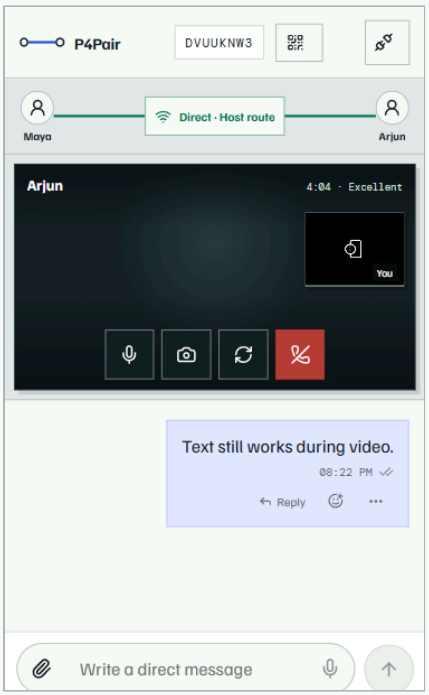

Voice calls

Direct browser-to-browser audio with call consent, duration, connection quality, mute, hang-up, and playback recovery.

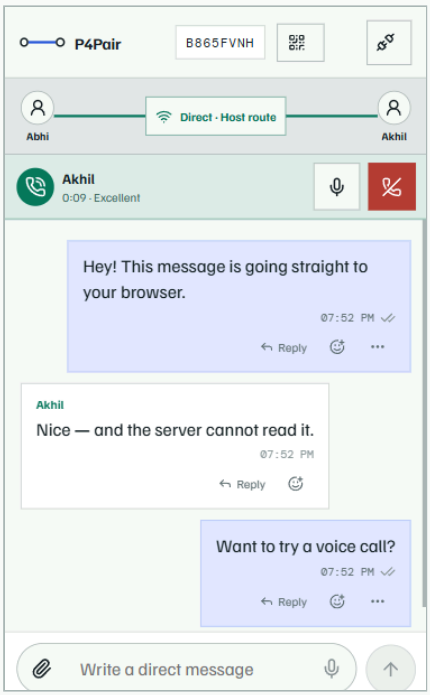

P

Installable PWA

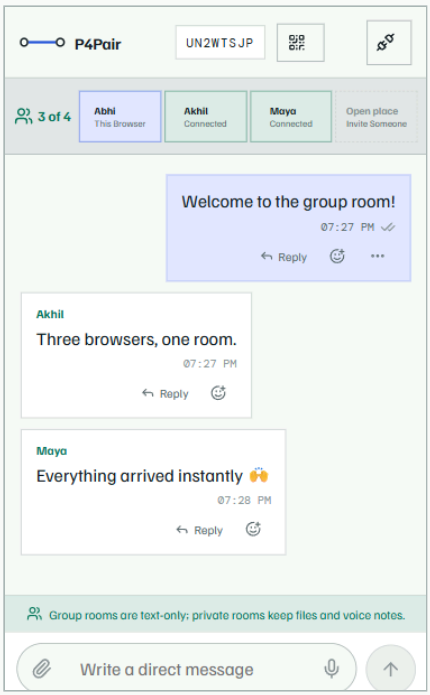

P4Pair can be installed on phones and laptops, launches like an app, and keeps an offline application shell.

Private video calling

Private voice calling

Text groups for up to four

Also included

- ✓ Direct messages with delivery and seen ticks
- ✓ Replies, emoji reactions, edits, and deletion
- ✓ Usernames and typing indicators
- ✓ Files and voice messages with waveforms
- ✓ QR invitations and native sharing
- ✓ Connection route and quality details
